User Registration CRUD Application

This is a simple Java-based User Registration CRUD application that performs Create, Read, Update, and Delete operations using JDBC. The application allows users to register, view a list of all registered users, update user details, and delete users.

Technologies Used

- **Java (JDBC)**: The application is built using Java with JDBC for database interaction and CRUD operations.
- MySQL: The database used to store user registration data.
- JSP (JavaServer Pages): Used for rendering dynamic HTML pages.
- **Servlets**: To handle HTTP requests and manage the flow of data between the frontend and back-end.

Features

- Register a new user
- View a list of all registered users
- Update user details
- Delete a user
- User details include name, email, phone number, date of birth, and address.

Project Setup

Prerequisites

- JDK 8 or higher
- MySQL database
- Maven (for dependency management)

Steps to Run the Application

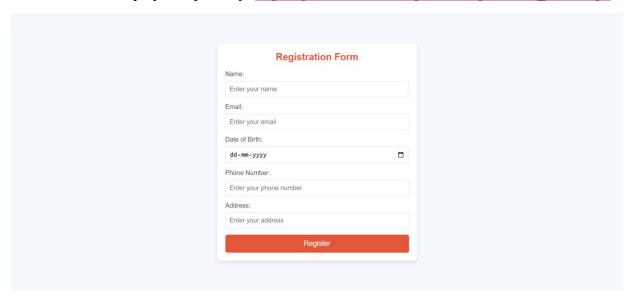

- 1. Clone the repository.
- 2. Navigate into the project directory.
- 3. Configure the Database:
 - o Create a database in MySQL with the name "Registration".
- 4. Update the database connection settings in the code.
- 5. Run the application:
 - o Deploy the project to a servlet container like Apache Tomcat.
 - Access the application through your browser at http://localhost:8080/registration-management.

Project Structure

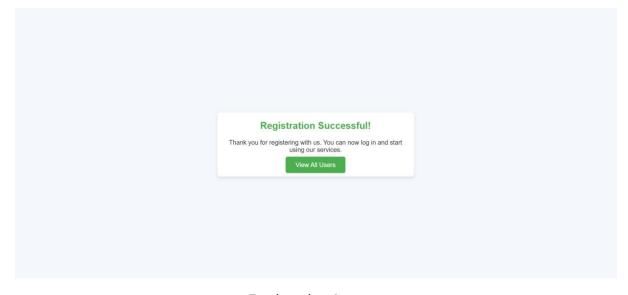

- /src/main/java: Contains the Java source code (Servlets, DAO, and Models).
- /src/main/webapp/WEB-INF: Contains JSP files for the front-end.
- /src/main/resources: Contains configuration files (e.g., db.properties).
- /lib: External libraries used in the project.
